PROFILE

Senior full-stack engineering leader with 10+ years of experience designing and delivering cloud-native enterprise applications, distributed .NET services, React platforms, and AI-assisted engineering workflows. I paired hands-on implementation with technical leadership to modernize complex systems, improve delivery practices, and build secure, scalable software across AWS, Azure, and GCP.

CORE STRENGTHS

- Technical leadership across architecture, implementation, mentoring, and delivery.
- Distributed .NET microservices, event-driven processing, real-time synchronization, and cloud-native application modernization.
- React and TypeScript platform delivery, including shared component libraries and design-system adoption.
- AI-assisted development workflows, multi-agent systems, LLM-ready documentation, and developer productivity tooling.
- Technical discovery, stakeholder advisory, CI/CD, infrastructure automation, observability, testing, and production-quality delivery practices.

SKILLS

Frontend

React, TypeScript, JavaScript, Next.js, Mantine, Nextra, HTML5, CSS

Backend

.NET, C#, Node.js, PostgreSQL, Redis, OpenAPI, ReactiveX

Infrastructure

AWS, Azure, GCP, Docker, Terraform, GitHub Actions, Octopus Deploy, OpenTelemetry, GitHub Copilot

EXPERIENCE

Software Squad Lead (HaulX) @ Fortescue

Sept 2025 - Present (9 mos)

HaulX is an enterprise fleet platform for manned and autonomous mining operations. In this role, I led AWS-hosted Offboard .NET microservices, autonomous asset control services, telemetry workflows, and React applications for controllers and operators while staying hands-on across architecture, modernization, and delivery.

Stack: AWS, .NET, C#, React, TypeScript, Rx.NET, Event-Driven Architecture, Microservices, Base UI, Fumadocs, npm, Docker Swarm, Octopus Deploy, Azure DevOps

- **Autonomous platform delivery.** Led the design and delivery of backend services and platform capabilities for autonomous mining operations across Offboard systems and onboard computers.
- **Autonomous asset synchronization service.** Modernized a core service that synchronized live tasks, permissions, commands, and operational state between Offboard systems and autonomous assets.
- **Partitioned event processing.** Designed partitioned command and event queues for internal event-driven processing, increasing throughput while preserving ordering guarantees for asset-specific workloads.
- **Reactive state synchronization.** Applied Rx observables over in-memory stores to improve synchronization of active tasks, permissions, and live asset state for downstream services.
- **Shared React UI library.** Partnered with UI/UX to replace legacy HaulX UI with a Figma-aligned React library, npm packages, live documentation, and LLM-ready coding-agent migration guidance.
- **Architecture, discovery, and hiring.** Drove architecture for large HaulX features, translated discovery into delivery-ready tickets, ran client stakeholder closeouts, and interviewed architect and developer candidates.

Lead Developer @ Komo Technologies

Feb 2021 - Sept 2025 (4 yrs 7 mos)

Komo is a gamified marketing SaaS platform for lead generation and audience engagement. I provided technical leadership for a five-person engineering team while remaining hands-on across architecture, implementation, mentoring, and delivery.

Stack: .NET, React, TypeScript, Next.js, PostgreSQL, Redis, OpenTelemetry, GitHub Actions, Docker, AI Agents

- **Platform architecture and modernization.** Led multiple large-scale refactors including migration to Turborepo, reducing main app bundle size by 40%, introducing shared libraries/config, and replacing a legacy component library with Mantine for faster development and light/dark mode support.
- **API architecture modernization.** Transitioned from N-tier to Onion + Mediator pattern, standardizing authorization pipelines, implementing the outbox pattern for reliable event persistence, and reducing unused code.
- **Analytics and workflow scalability.** Evolved analytics into an event store model with database projections and transient event subscribers; built a Zapier-like workflow system powered by these events, including a drag-and-drop front-end workflow builder and back-end processing engine leveraging the event store for reliable, real-time execution.
- **Delivery acceleration and cost reduction.** Implemented conditional GitHub Actions builds, database CI/CD testing workflows, and Next.js App Router with Turbopack for faster deployments.
- **AI content generation system.** Developed a multi-agent AI content generation system that produced interactive campaign experiences, adapted outputs to customer brand data, and provided real-time insights and recommendations.
- **Data Feeds product launch.** Conceived and delivered the Data Feeds product, enabling multi-page, screen-size-specific layouts with text, images, videos, and live data blocks such as Q&A feeds, leaderboards, and poll results. The product elevated live-event experiences and helped secure new business opportunities.

Senior Full Stack Developer @ BHP

Oct 2020 - Feb 2021 (4 mos)

Contributed to BHP's Dash project, a field-device platform that provided fitters with installation instructions, captured integrated sensor data, and synchronized results to a web platform over device Wi-Fi.

Stack: .NET Core, C#, React, Docker, Azure DevOps, InfluxDB

- **Sensor data processing pipeline.** Enhanced .NET Core container performance for parsing high-volume raw sensor data into an Influx database, improving reliability and efficiency.
- **Real-time equipment dashboards.** Created user-friendly gauges and graph controls for a React SPA, improving live data visualization and user experience for field technicians.
- **Knowledge sharing and standards adoption.** Mentored team members on .NET best practices and React fundamentals, promoting consistent coding standards and accelerating onboarding.

Senior Full Stack Developer @ Cash Converters

July 2019 - Oct 2020 (1 yr 3 mos)

Worked as a full-stack developer in the Personal Finance team, responsible for the loan application process and supporting services.

Stack: .NET, C#, TypeScript, CQRS, Rebus, Cypress, CI/CD

- **Event-driven messaging infrastructure.** Designed and implemented a CQRS-based event-driven messaging infrastructure using Rebus, enabling reliable inter-service communication and improving scalability across the platform.
- **Core loan application platform stabilization.** Led a complete overhaul of the main loan web application, migrating from JavaScript to TypeScript, simplifying complex code, and writing comprehensive documentation. Transformed the application from a high-maintenance, error-prone system into a stable, maintainable platform.
- **Quality assurance and release confidence.** Achieved full test coverage for the loan application using Cypress, integrated into the CI/CD pipeline to ensure consistent quality and reduce production issues.

Senior Full Stack Developer @ BHP

Apr 2019 - July 2019 (3 mos)

During my short contract role, I led the rewriting of small applications from .NET/AngularJS to React/.NET Core, with a focus on mobilization and resource allocation for mine shutdowns.

Stack: .NET Core, C#, React, TypeScript, CQRS, Mediator

- **TypeScript adoption in React projects.** Advocated for and demonstrated TypeScript integration in React applications through examples and technical discussions with principal engineers, leading to its adoption across projects for improved type safety and maintainability.
- **CQRS authorization pattern.** Introduced a pattern within the CQRS Mediator to handle authorization via attributes, replacing API-layer checks. This made it easier to test, extend, and run additional validations within mediator actions.

Senior Full Stack Developer @ Diversus

Aug 2018 - Apr 2019 (8 mos)

Worked as a full-stack developer at Diversus, delivering front-end and back-end features for bespoke C# .NET web applications across multiple client organizations.

Stack: C#, .NET, JavaScript, SQL

Full Stack Developer @ Clickhome

Sept 2016 - Aug 2018 (1 yr 11 mos)

Worked as a full-stack developer at ClickHome, building C# .NET and AngularJS features for enterprise project management software used by home builders.

Stack: C#, .NET, AngularJS, JavaScript, SQL
